The University of Cincinnati was the first institution west of the Appalachian mountains to offer a PhD in Physics. Nowadays, the Physics Department offers a modern graduate program leading to Master and Doctoral degrees in Physics. The main areas of concentration are astronomy, condensed matter & statistical physics, and particle physics & cosmology. There are also opportunities in applied and bio/medical physics in collaboration with the Chemistry Department, the School of Engineering, and the Medical School. Our medium-size graduate program is large enough to be quite diverse, yet small enough so that every student receives individual attention. We currently have more than 60 graduate students, of whom more than 20% are women and there are several couples. At the undergraduate level we offer flexible BS and BA degrees that prepare students for a variety of careers and can lead smoothly towards graduate studies via a combined Bachelor-Masters program. In addition to general information about our program and department, the poster will also outline our recent efforts to further increase diversity.
