Move Over Rover: There’s A New Sniffing Powerhouse in the Neighborhood

Researchers study animals’ unique sense of smell to develop improved chemical sensors.

EMBARGOED FOR RELEASE until Monday, Nov. 19, 2018, 10:30 a.m. ET

WASHINGTON, D.C., November 19, 2018 -- Some animals have a superpower in their sense of smell. They explore, interpret and understand their world with such sensitivity that people have enlisted canines to help solve crime and detect cancer on the breath. Scientists at the Georgia Institute of Technology are now homing in on the secrets behind animals’ super sniffers to develop an artificial chemical sensor that could be used for a variety of tasks, from food safety to national security.

“We turned to animals to understand what nature has already figured out,” said Thomas Spencer, a doctoral candidate in David Hu’s lab at Georgia Tech. “We are applying the underlying principles that we learned about these mechanisms to design a better sensor.”

Spencer will present the group’s latest design for an electronic nose that concentrates odors for improved chemical sensing at the American Physical Society’s Division of Fluid Dynamics 71st Annual Meeting, which will take place Nov. 18-20 at the Georgia World Congress Center in Atlanta, Georgia.

Their work began inauspiciously at a competition to develop a sensor that could identify different varieties of cheese. Turning to nature to guide their work, they traveled to the Atlanta Zoo to compare the way different animals sniff, from mice to elephants.

“We wanted to measure the sniffing frequency of animals when they are trying to identify a new source of food or something that interests them,” Spencer said.

After reviewing the data, they found that sniffing speed decreases as body size increases; put another way, mice sniff faster than elephants. Using their findings, they designed a customized pump that oscillates back and forth at the same frequency that animals sniff. The design of their device moves airflow around the chemical sensor in a more controlled fashion.
“These findings are important because it gives us insight into the physics of sniffing,” said Hu, an associate professor of mechanical engineering and biology at Georgia Tech. “This information will affect how we scale up sniffing machines.”

Because odor is invisible, the team used wind tunnel experiments and computer simulations to analyze how the odor particles moved through the air. In addition, they gathered sensor information in real time to see how the chemical compounds vary throughout the air in space and time.

While the team initially designed the electronic nose to distinguish different varieties of cheese, the fundamental principles behind their device could be used in many different applications.

“This is still a fairly new study,” Spencer said. “Our hope is to get a snippet of that ability and replicate it for ourselves.”

Adams Clark joined Spencer and Hu on this study. They received funding from the National Science Foundation.

###

Presentation G17.1, "What is the best frequency for sniffing?" by Thomas Spencer, Adams Clark and David L. Hu, will be Monday, Nov. 19, 10:35 a.m. in Room B304 of the Georgia World Congress Center in Atlanta. Abstract: [http://meetings.aps.org/Meeting/DFD18/Session/G17.1](http://meetings.aps.org/Meeting/DFD18/Session/G17.1)

Hotel information: [https://www.apsdfd2018.org/hotels/](https://www.apsdfd2018.org/hotels/)

GALLERY OF FLUID DYNAMICS

At the Annual Meeting, The Gallery of Fluid Motion will consist of posters and videos submitted by attendees illustrating the science and beauty of fluid motion. More information can be found here: [https://gfm.aps.org/](https://gfm.aps.org/).

PRESS REGISTRATION
We will grant free registration to credentialed journalists and professional freelance journalists. If you are a reporter and would like to attend, contact Rhys Leahy or the AIP Media Line (media@aip.org, 301-209-3090). We can also help with setting up interviews and obtaining images, sound clips or background information.

**LIVE MEDIA WEBCAST**

**ABOUT DFD**

The Division of Fluid Dynamics of the American Physical Society, established in 1947, exists for the advancement and diffusion of knowledge of the physics of fluids with special emphasis on the dynamical theories of the liquid, plastic and gaseous states of matter under all conditions of temperature and pressure. For more information about DFD, visit [https://www.aps.org/units/dfd/](https://www.aps.org/units/dfd/).

**ABOUT APS**

The American Physical Society (APS) is a nonprofit membership organization working to advance and diffuse the knowledge of physics through its outstanding research journals, scientific meetings, and education, outreach, advocacy, and international activities. APS represents over 55,000 members, including physicists in academia, national laboratories, and industry in the United States and throughout the world. For more information about APS, visit [https://www.aps.org/](https://www.aps.org/).
